CONDITIONAL EXECUTION

logical AND	logical OR	logical NOT
and	or	not

Fundamentals of Computer Science I

Outline

Conditional Execution

- if ...
- if ... else ...
- if ... elif ... else ...
- Nested if ... statements
- A look at Enumerations

Comparisons

• Given two numbers \rightarrow return a **boolean**

operator	meaning	true example	false example
==	equal	7 == 7	7 == 8
! =	not equal	7 != 8	7 != 7
<	less than	7 < 8	8 < 7
<=	less than or equal	7 <= 7	8 <= 7
>	greater than	8 > 7	7 > 8
>=	greater than or equal	8 >= 2	8 >= 10

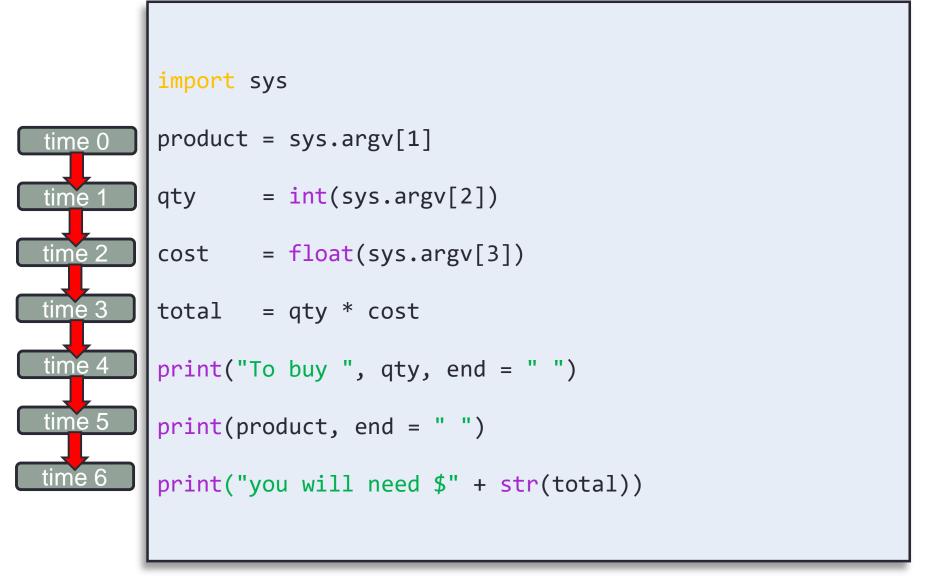

Is the sum of a, b and c equal to 0? Is grade in the B range? Is sumItems an even number? (a + b + c) == 0
(grade >= 80.0) and (grade < 90.0)
(sumItems % 2) == 0</pre>

Leap Year Example

- Years divisible by 4 but not by $100 \rightarrow$ leap year
- Years divisible by 400 \rightarrow leap year

```
year = int(input("Enter the year: "))
isLeapYear = False
# Leap year if divisible by 4 but not by 100
isLeapYear = (year % 4 == 0) and (year % 100 != 0)
# But also leap year if divisible by 400
isLeapYear = isLeapYear or (year % 400 == 0)
print(isLeapYear)
```

Sequential Flow of Control

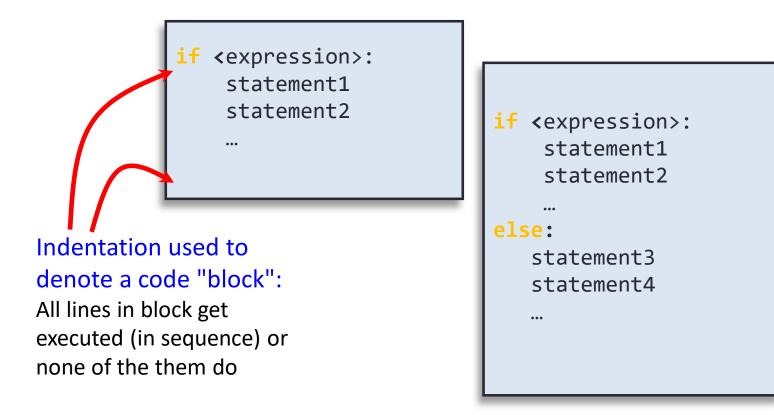

Control Flow

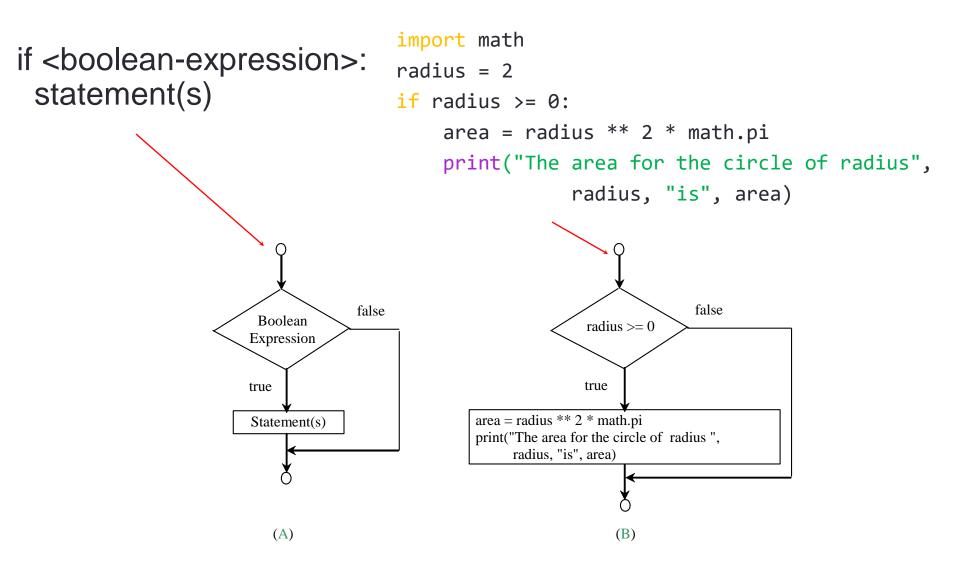

- Default flow of control is sequential
- Interesting and powerful programs need:
 - To skip over some lines
 - To repeat lines
- Conditionals → sometimes skip parts
 - A branching statement chooses between two or more possible actions
- Loops \rightarrow allow repetition of lines
 - A loop statement repeats an action until a stopping condition occurs
 - We have talked a bit about for loops, and we will talk about loops more

if Statement

- Most common branching statement in all languages
 - Evaluate a boolean expression, after the if
 - If True, do some stuff
 - [optional] If False, do some other stuff

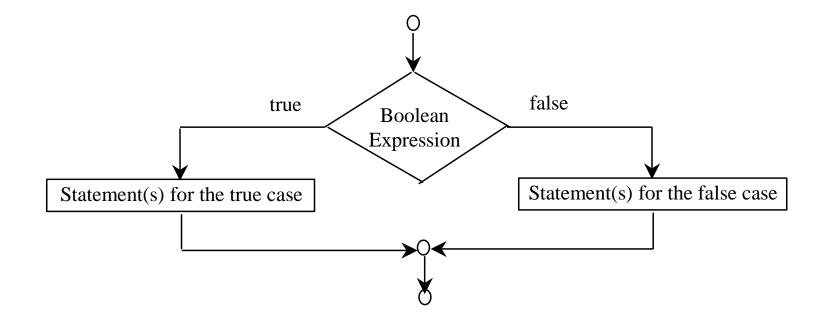

One-way if Statements

The Two-way if Statement

if <boolean-expression>:
 statement(s)-for-the-true-case
else:

```
statement(s)-for-the-false-case
```

if...else Example

import math

radius = -1

```
if radius >= 0:
    area = radius ** 2 * math.pi
    print("The area for the circle of radius", radius, "is", area)
else:
    print("Negative input")
```

Multiple Alternative if Statements

```
score = float(input("Enter the score: "))
if score \geq = 90:
    grade = 'A'
elif score \geq 80:
    grade = 'B'
elif score \geq 70:
    grade = 'C'
elif score \geq = 60:
    grade = 'D'
else:
    grade = 'F'
```

```
print (grade)
```

Note

The <u>else</u> clause matches the <u>if</u> clause that is at the same level of indentation

```
if 7 < 5:
    print("Wrong")
    if 5 > 7:
        print("really wrong")
else:
    print("else goes with outer if")
```

If you have a boolean variable, you can test its value directly instead of testing to see if it is equal to True or False.

```
even = True
if even == True:
    print("TRUE")
if even:
    print("TRUE again")
```

Booleans

not a	\rightarrow "Is a set to false?"
a and b	\rightarrow "Are both a <i>and</i> b set to true?"
a or b	\rightarrow "Is either a <i>or</i> b (or both) set to true?"

а	b	a and b	a or b	а	not a
false	false	false	false	true	false
				false	true
false	true	false	true		
true	false	false	true		
true	true	true	true		

if Examples

Take absolute value of x

import random
if random.random() < 0.5:
 print("heads")
else:
 print("tails")</pre>

Flip a fair coin and print out the results.

Put x and y into sorted order

```
if len(sys.argv) > 1:
    num = int(sys.argv[1])
```

If a command line option is passed in, use it as the value for num.

Let's Try One!!

- If the unicorn is mythical, then it is immortal, but if it is not mythical, then it is a mortal mammal. If the unicorn is either immortal or a mammal, then it is horned. The unicorn is magical if it is horned.
- Write a program named *Unicorn.py* that determines whether unicorns are mythical, immortal, mortal, mammal, magical or horned, and output these to the screen. Notice, there is no user input to this program. Your program only needs to use the above statements to determine which characteristics are true.

The Ternary Conditional Operator

- **if** n1 > n2:
 - max = n1
- else:
 - max = n2
- Can be written as

max = (n1 if n1 > n2 else n2)

- A shortcut for the full if...else statement
- Should only be used for very short pieces of code

The Ternary Conditional Operator

Useful with print statements.

print("You worked", hours, "hours. " if hours > 1 else "hour.")

Input Validation

 You should check user input to ensure that it is within a valid or reasonable range. For example, consider a program that converts feet to inches. You might write the following:

```
feet = int(input("Enter feet: "))
inches = feet * 12
```

- What if:
 - The user types a negative number for feet?
 - The user enters an unreasonable value like 100? Or a number larger than can be stored in an int? (2,147,483,647)

Input Validation

 Address these problems by ensuring that the entered values are reasonable:

```
feet = int(input("Enter feet: "))
if feet >= 0 and feet < 10:
    inches = feet * 12
....</pre>
```

Mathematical Expressions: Parentheses and Precedence

- Parentheses can change the order in which arithmetic operations are performed
 - examples:

```
(cost + tax) * discount
(cost + (tax * discount))
```

 Without parentheses, an expressions is evaluated according to the rules of precedence, with the lowest precedence listed at the top.

	— • • •
Operator	Description
or	Boolean OR
and	Boolean AND
not x	Boolean NOT
<, <=, >, >=, !=, ==	Comparisons, including membership tests and identity tests
+, -	Addition and subtraction
*, /, %	Multiplication, division, remainder
**	Exponentiation

Precedence Rules

In what order are the operations performed?

score < min/2 - 10 or score > 90
score < (min/2) - 10 or score > 90
score < ((min/2) - 10) or score > 90
(score < ((min/2) - 10)) or score > 90
(score < ((min/2) - 10)) or (score > 90)
(score < ((min/2) - 10)) or (score > 90))

score < (min/2 - 10 or score > 90)

You Try It

- Write a program with an if statement that reports whether you passed or failed based on the character entered at the command line. A, B, and C are passing, D and F are not.
- Submit your program, named Grades.py, to the Activity03 dropbox on Moodle. You get 1 extra credit point for turning something in, 2 points if it is correct.
- Don't forget! Always put your name and a description in a header comment!
